The rinsate blank is the aqueous sampling I am referring to. I will await your advice regarding my questions.

Thanks,

Ben Nwosu

Good Morning Ben:

Lyndsey is in a training all week. However, we will be discussing NFB, HTC and CRU issues when she has spare time. We have discussed the Ra-226 issue you mention below. I will wait for Lyndsey to confirm but I believe we talked about removing the preliminary values for Ra-226 (without 21-days in-growth).

The rinsate blank is the sample you reference in regard to aqueous matrix action level, correct? Lyndsey will need to comment on this.

Thanks

Good morning Lyndsey,

Radium-226 was analyzed by gamma spec with and without 21-days in-growth methods. We are aware that the analytical results for radium-226 without in-growth is subject to bias from the presence of other radionuclides in the soil sample; while the 21-days in-growth method is supposed to eliminate that bias.

Please can you advise if the action level for radium-226 applies to both analytical methods. The attached table indicates that the background sample has exceeded the action level for radium-226 if the action level applies to both methods. In this case:

- 1) do you want to specify a different action level for radium-226
- 2) should I delete all radium-226 data analyzed without 21-days in-growth
- 3) indicate NS (not specified) in the action level column of the data table
- 4) do we have an action level for aqueous matrix (pg. 3 of the table)

Thank you.

Ben Nwosu
